

ANTIHERO AI · LIVE GUIDE · FREE

WEBSITES ON AUTOPILOT.

How you get a real, award-style website built by an AI coding agent while you watch, check and decide. The interview, the plan, every build prompt, the visuals, the autopilot loop, and the review. The exact workflow behind the Aura Homes site.

FRIDAY, OCTOBER 2, 2026 · FACEBOOK LIVE

READ THIS FIRST · 3 MINUTES

WHAT'S INSIDE

You're about to build a website the way agencies wish they could: you make the decisions, and an AI does the typing, one small job at a time, while a second AI checks its homework. Autopilot doesn't mean you take a nap. It means you set the destination and watch the instruments.

00 **The pre-checklist.** Brand first. If it isn't done, stop here

01 **The words.** Seven terms, explained once

02 **The interview.** Your AI asks, you answer, you get a Site Brief

03 **The section plan.** Every page, every section, every visual

04 **Write all the prompts.** One meta-prompt, one RULES paragraph, a stack of TASKs

05 **The visuals.** Grok Imagine stills and scroll videos

06 **The autopilot.** Grok Build builds, Grok Bot checks, you approve

07 **The build prompts.** Hero to 3D, ready to paste

08 **Review and fix.** Localhost, hard refresh, fix list, credits

09 **Make it stand out.** No slop rules, visual and features interviews, elevation passes, jury review

10 **Pick what you need.** Most sites shouldn't use all of this

11 **Links.** Every tool, checked Oct 2, 2026

HOW TO USE THIS GUIDE

Work top to bottom. Every grey box is a prompt: copy all of it. Text in **[red brackets]** is yours to fill in. In the build prompts, **[RULES]** means paste your whole RULES paragraph there. The full text of every prompt is also in **prompt-guide.md** in the group, so you can copy without fighting a PDF.

TONIGHT Tonight's demo brand is Antigirl. Next up is an AntiHero site that lists every guide in the group, built the same way.

00

THE PRE-CHECKLIST

A website is your brand in a trench coat. If the brand isn't decided, the AI decides for you, and the AI's taste is the average of the internet. Tick all five before you start.

- [ ] **Brand voice is written down.** Three traits, a banned words list, a couple of before and after examples.
- [ ] **Your logo is done.** Ideally an SVG, plus a white version for dark backgrounds.
- [ ] **Colors and fonts are picked.** Hex codes with a job for each color. Two fonts, max.
- [ ] **You have a tagline.** Short, true, and yours.
- [ ] **You have a brand brain.** One doc with all of the above that your AI reads first, every time.

NOT DONE YET?

Go through **Build a Brand From Scratch With AI**, the October 1 guide in the group. It takes an evening and it makes every step in this guide better. Come back with your brand brain.

SHORTCUT Missing just one piece? Make a stand-in, mark it TODO in your RULES paragraph and keep going. Just don't ship it like that.

TOOLS ON YOUR COMPUTER

- [ ] **Node.js (LTS)** nodejs.org
- [ ] **Git** git-scm.com
- [ ] **Grok Build** installed and logged in. Install command in step 06.
- [ ] **Two folders** one for the project, one called **assets** with your logo, fonts and images.

01

THE WORDS

You'll hear these all night. Here's what they mean in English.

GROK BOT	Your AI teammate on a cloud computer. It interviews you, writes the plan and the prompts, and checks every step. x.ai/bot
GROK BUILD	xAI's coding agent. It runs in a terminal on your computer, inside your project folder, and writes the actual files. x.ai/cli
GROK IMAGINE	xAI's image and video generator. grok.com/imagine
ASTRO	The website framework. Fast pages, very little code sent to the visitor. astro.build
GSAP	The animation library behind most award-winning sites. Free, plugins included. gsap.com
SCROLLTRIGGER	The GSAP plugin that ties animation to your scroll. Scroll down, it happens. Scroll up, it un-happens.
LENIS	Makes scrolling feel smooth and weighted instead of jumpy. lenis.darkroom.engineering
THREE.JS	Real 3D in the browser: landscapes, glass, steam, models. threejs.org
AWWWARDS	The website awards site. The best free mood board there is. awwwards.com
RULES	One paragraph of non-negotiables pasted at the top of every build prompt.
TASK	One job for the coding agent. One prompt, one job, one commit.
COMMIT	A saved checkpoint in git. Something breaks, you go back. You lose nothing.
LOCALHOST	Your site running privately on your own computer. Nobody else can see it.

PART ONE

THE PLAN.

The AI is a brilliant builder with no taste of its own. So before anybody writes code, you get interviewed, you get a plan, and the AI writes every instruction the builder will ever get.

STEP 02 · 20 TO 40 MINUTES · VOICE TYPING RECOMMENDED

02

THE INTERVIEW

Start one long chat with Grok Bot (or any decent chat AI) so it remembers everything you decide. Attach your brand brain. Then let it ask the awkward questions an agency would charge you for.

PROMPT 01 · INTERVIEW ME ABOUT THE SITE

```
You are a senior web designer and art director who has built sites that won Awwwards Site of the Day.
Interview me to plan a website. Read my brand brain first: [paste it or attach it].

Ask me one question at a time. Wait for my answer before the next one. Push back if an answer is vague.
Cover:
1. What the site is for, in one sentence, and the one action a visitor should take.
2. Who the visitor is: a specific person, what they want, what they're afraid of, what device they're
on.
3. The offer: what I sell or give away, and why anyone should care.
4. The pages and sections I think I need (you'll fix this list later).
5. The vibe in three words, and three words it must never feel like.
6. Three to five reference sites I love (Awwwards, Godly, anything) and exactly what I love about each.
7. What I already have: logo, photos, video, copy, fonts, an old site.
8. What must never change (an existing page, a video, legal wording).
9. Motion appetite from 1 to 10: 1 is a calm brochure, 10 is a 3D scroll movie.
10. Hard limits: deadline, budget, hosting, things I legally can't say.

When you have enough, write a one-page Site Brief: goal, visitor, offer, vibe, references and what to
steal from each (the thinking, not the look), what exists, what's protected, motion level, limits. Then
ask me what you got wrong.
```

FIND YOUR REFERENCES

Go to awwwards.com, open Websites, filter to Sites of the Day, and screenshot three you'd steal from. Write one line on **what** you love about each: the scroll, the type, the way the menu opens. Steal the thinking, not the look. The Aura Homes references were Lando Norris, Igloo Inc, Cozy Lake Cabin, Edelschwarz and The Floating Forest.

PRO MOVE Answer out loud with voice typing. You'll say better stuff than you'd type, and you'll stop editing yourself.

03

THE SECTION PLAN

Now you turn the Site Brief into pages and sections. The trick is the Version 2 list at the bottom: everything you love but don't need yet goes there, so version 1 actually ships.

PROMPT 02 · WRITE THE SECTION PLAN

```
Using the Site Brief, write the section plan for the site.

For each page: the URL, its one job, and its sections in order. For each section: a name, what it says
(draft headline and one line of copy in my brand voice), what the visitor sees (image, video, 3D,
plain), and the one effect that earns its place there (or "none"). Mark which sections are protected
and must never be changed once built.

Rules: the homepage hero gets the most attention. No more than one "wow" effect per section. Every page
ends with the one action from the brief. Keep the first version small enough to ship in a weekend, and
put everything else in a "Version 2" list at the bottom.

Then list every image and video I need, with a short Grok Imagine prompt for each, the aspect ratio,
and where it goes.
```

READ IT OUT LOUD

If a section's job takes more than one sentence to explain, it's two sections, or zero. Cut one on purpose. It feels great.

The plan also lists every image and video you need, with a Grok Imagine prompt for each. Save that list. You need it in step 05.

04

WRITE ALL THE PROMPTS

You don't write the build prompts. You make the AI write all of them, in order, each one complete on its own, each one starting with the same RULES paragraph. That's what lets a coding agent work for hours without forgetting your brand or wrecking the part you love.

PROMPT 03 · WRITE ME ALL THE BUILD PROMPTS

```
Now write the complete build package for Grok Build, the coding agent that will build this site in my
project folder.

Format:
1. Start with one RULES paragraph that every prompt repeats word for word. It must include: the project
type (Astro site, or tell me if something else fits better), my brand name spelled correctly, fonts and
colors with hex codes, my voice rules and banned words, everything that must never be touched, "do not
deploy", "do not delete files, move unused ones to /_archive", motion rules (calm or energetic, respect
prefers-reduced-motion, animate only transform and opacity), and "commit to git when done with a short
message".
2. Then numbered prompts, one job each, in build order: setup and backup, site map and navigation, each
page and section, imagery, then the motion and effects pass, then performance, credits page and QA.
3. Every prompt is one copy-paste block: the full RULES paragraph, then "TASK: [name]", then exact
instructions. Name files, components and routes. Say what "done" looks like and what to report back.
4. Each prompt must work on its own. Never write "as before" or "see above".
5. Anything borrowed (code, models, fonts, textures) must get a credits entry in the same commit.
6. Elevated by default: every prompt aims for an Awwwards Site of the Day result, not a regular
website. Each section gets one bold idea, real copy in my voice and a specific detail nobody else would
think of.
7. Put my NO SLOP RULES inside the RULES paragraph, word for word: [paste the NO SLOP RULES].

Write them all. Don't summarize. Save it as a file I can download.
```

WHY EVERY PROMPT REPEATS THE RULES

Coding agents have short memories and big enthusiasm. If the rules only live in prompt one, by prompt thirty it has redesigned your homepage and added a crypto section. Repeat them every time. It costs a paragraph and saves your site.

RULE Never let a prompt say "as before" or "see above". If a prompt can't be pasted alone, it isn't finished.

THE RULES PARAGRAPH

The AI writes this for you in step 04, but check it against the template. Brand, fonts, colors, voice, banned words, and the line that matters most: what must never be touched.

PROMPT 04 · RULES TEMPLATE

```
RULES: This is the [Brand] [Astro] site. Do NOT change [the protected page, video or section] in any
way. Do not deploy. Do not delete files; move unused ones to /_archive. Fonts: [display font] for
headlines, [body font] for text. Colors: [name #hex], [name #hex], [accent name #hex] (accent used
sparingly). Use the logo in /src/assets/logo wherever a logo is needed. Brand name is "[Brand]"
everywhere. Never say: [banned words or claims, e.g. prices, guarantees, competitor names]. Tone:
[three voice traits]. No em dashes, no exclamation points. Motion must feel
[calm, slow and expensive / quick and playful]: [long eases, nothing bouncy], respect prefers-reduced-
motion, animate only transform and opacity. Elevated by default: aim for an Awwwards Site of the Day
result, not a regular website; one bold idea per section, real copy, specific details. Follow the NO
SLOP RULES: [paste them]. Commit to git when done with a short message.
```

PROMPT 05 · RULES · THE ANTIGIRL VERSION

```
RULES: This is the Antigirl Astro site. Do NOT change the homepage hero video or its scroll logic once
it is approved. Do not deploy. Do not delete files; move unused ones to /_archive. Fonts: [Bebas Neue]
for headlines, [Barlow] for text. Colors: [Anti Black #0A0A0B] 60 percent, [Bone #ECE8E1] 30 percent,
[accent #hex] 10 percent. Use the Antigirl logo in /src/assets/logo wherever a logo is needed. Brand
name is "Antigirl" everywhere. Never say: delve, unlock, elevate, seamless, game-changer, empower,
journey. Tone: direct, funny, human. No em dashes, no exclamation points. Motion must feel confident
and quick but never bouncy: short eases, respect prefers-reduced-motion, animate only transform and
opacity. Elevated by default: aim for an Awwwards Site of the Day result, not a regular website. Follow
the NO SLOP RULES (Stage 9). Commit to git when done with a short message.
```

On Aura Homes the protected part was the splash page and its scroll video. Every one of 55 prompts said "do NOT change the splash/landing page in any way", and after 55 prompts it was still byte for byte the same. Boring sentence. Massive payoff.

PART TWO

THE BUILD.

Visuals first, then the coding agent gets your prompts one at a time. It builds, it commits, the watcher checks, you look, you approve. Repeat until it's a website.

05

THE VISUALS

Use grok.com/imagine (easiest) or the API at x.ai/api/imagine if you like code. Make the still, approve it, then animate it. Never put text in the image. The site adds the words.

PROMPT 06 · HERO STILL

> [Scene in one sentence], shot like a premium brand campaign, [time of day and light], [your palette] color grade, calm empty space on the [left] third for a headline, no text, no logos, photoreal, 16:9.

PROMPT 07 · SCROLL VIDEO FROM YOUR STILL

> Animate this image. Slow, steady camera [push-in / dolly right / rise], no cuts, no shake, no zoom pulses, subjects move gently, light stays constant, ends on a calm composed frame. [10] seconds.

WHY NO CUTS AND NO SHAKE

A scroll-scrubbed video gets played forwards and backwards by your visitor's thumb. Any cut or camera jump looks like a glitch. One slow, steady camera move scrubs like butter. Ten seconds is plenty.

RULE Keep the same light and color grade across every image, so the whole site feels like one world. AntiHero lives in golden hour. Pick yours.

06

THE AUTOPILOT

INSTALL GROK BUILD

```
# Mac or Linux, in Terminal
curl -fsSL https://x.ai/cli/install.sh | bash
# Windows, in PowerShell
irm https://x.ai/cli/install.ps1 | iex
# then, inside your project folder
grok
```

The first launch opens a browser to log in. Inside Grok Build, type **/model** to switch models. Grok 4.7 Fast is great for quick jobs like copy and simple sections. Switch back to the bigger model for 3D, transitions and anything with "refactor" in it. Docs: docs.x.ai/build/overview.

THE LOOP

1. Paste prompt N into Grok Build. Let it work. Don't help.
2. It commits. That's your checkpoint.
3. Grok Bot checks the commit: did it do the task, did it touch anything protected, did it follow the RULES.
4. You look on localhost and hard refresh: Ctrl+Shift+R on Windows, Cmd+Shift+R on Mac.
5. Good? Next prompt. Bad? Paste Grok Bot's fix prompt, or roll back.

PROMPT 08 · THE WATCHER · GIVE THIS TO GROK BOT

```
You're my build supervisor. Here is the full build package: [attach it]. Grok Build is running these
prompts one at a time in my project. After each one I'll paste its final report and the output of `git
show --stat HEAD` (and the diff if it's small).

For each step tell me:
1. Done or not done, against the TASK's own definition of done.
2. Did it touch anything the RULES protect? Name the file.
3. Any RULES broken (banned words, em dashes, wrong colors, missing credits entry, deploys, deleted
files).
4. What to look at on localhost before moving on.
5. If something is wrong: the exact fix prompt to paste back into Grok Build, with the RULES paragraph
on top.
Then give me the next prompt number. Keep it short.
```

ROLL BACK, DON'T PANIC

Something will break. That's not the workflow failing, that's the workflow. Read the error, paste it into Grok Bot, paste the fix back. Because every prompt commits, the worst case is you lose one step.

```
# see your checkpoints
git log --oneline
# then ask Grok Build, in plain English
Revert the last commit, keep a backup branch called backup-[date].
```

FULL AUTOPILOT

If your Grok Bot can see the project directly (a shared repo or folder), tell it to run git log and git diff itself after every step. Now you're approving, it's checking, Grok Build is building. On Aura Homes that's how 55 prompts went through without the protected splash page moving a pixel.

RULE Keep your hands off the code while the agent works. Two people editing the same file is how you get a website with two front doors.

THE ORDER THAT WORKS

- **Setup and backup** first, always.
- **Structure:** site map, navigation, then each page and section.
- **Imagery:** drop in your Grok Imagine visuals.
- **Motion:** smooth scroll, reveals, scroll video, transitions, 3D, glow.
- **Finish:** media compression, credits page, QA.

Effects come last. Decorating before the walls are up gets you a very pretty tent.

07

SETUP, HERO, NAV

Examples, ready to paste. Your step 04 package will have its own versions written for your site. Use these to check them, or to fill gaps.

PROMPT 09 · SETUP AND BACKUP

```
[RULES]

TASK: Project setup and backup
Create a new Astro project in this folder (latest stable, TypeScript strict, no UI framework yet). Add Tailwind only if I said so in the brief. Set up git, a .gitignore for node_modules and .env, and make a first commit called "Fresh start". Create /src/assets/logo, /src/assets/img, /public/media and /_archive. Copy my logo files from [path to assets folder] into /src/assets/logo and my fonts into /public/fonts with @font-face rules in a global CSS file. Add CSS variables for every brand color. Tell me the command to run the site locally and the URL.
```

PROMPT 10 · HOMEPAGE HERO

```
[RULES]

TASK: Homepage hero
Build the homepage hero as src/components/Hero.astro. Full viewport height. Background: [image or looping muted video] from /public/media/[file], with a poster image so something shows instantly. Headline "[headline]" in the display font, very large, low-left, with generous empty space. One line under it: "[subline]". One button: "[CTA text]" linking to [URL]. Text must pass contrast over the image (add a soft dark gradient behind it if needed). On mobile, use the still image, not the video. Show me a screenshot description of desktop and mobile.
```

PROMPT 11 · NAVIGATION AND MENU

```
[RULES]

TASK: Navigation and menu
Build a slim top bar (about 56px): logo left, text links [Page 1, Page 2, Page 3], and an outlined "[CTA]" button right. Transparent over the hero, soft frosted background after 80px of scroll, hides on scroll down and comes back on scroll up. Under 1024px show only the logo and a "Menu" button that opens a full-screen menu with big links. Menu button: 44px minimum tap target, aria-expanded, Escape closes, focus stays inside the open menu and returns to the button on close. Add the same links to the footer.
```

SECTIONS AND SMOOTH SCROLL

PROMPT 12 · ONE SECTION

[RULES]

TASK: [Section name] section
Build src/components/[SectionName].astro and add it to [page] after [previous section]. Purpose: [one job of this section]. Content: headline "[headline]", copy "[copy]", [cards / image grid / testimonial / FAQ list]. Layout: [describe it, or "steal the structure of [reference site]'s [section], not the look"]. Use only brand fonts and colors. Mobile first, then desktop. No effects yet; motion comes in a later prompt.

PROMPT 13 · LENIS SMOOTH SCROLL

[RULES]

TASK: Smooth scroll foundation
Install Lenis and GSAP. Wire Lenis to GSAP ScrollTrigger site-wide (lenis.on('scroll', ScrollTrigger.update) and drive Lenis from gsap.ticker). [Except the protected page; leave its scroll logic exactly as is.] Create src/scripts/motion.ts with shared eases, durations and a prefers-reduced-motion check, so every later effect uses the same feel. With reduced motion on, Lenis is disabled and scrolling is native. Anchor links must still land in the right place.

PROMPT 14 · GSAP SCROLLTRIGGER REVEALS

[RULES]

TASK: Scroll reveals
Create a reusable reveal system using GSAP ScrollTrigger and the shared settings in src/scripts/motion.ts. (1) Headings: a <RevealHeading> component that splits text into lines (GSAP SplitText), each line masked and rising from below with a 0.06s stagger when it enters the viewport. (2) Images: a clip-path "window opening" from the center outward while the image inside scales from 1.1 to 1. (3) Cards in grids stagger by 0.1s. Each animation plays once. Use on every H1 and H2 [outside the protected page]. Reduced motion: everything is simply visible.

SCROLL VIDEO, TRANSITIONS

The video that plays as you scroll. Make the clip in step 05 first.

PROMPT 15 · SCROLL-SCRUBBED VIDEO

```
[RULES]

TASK: Scroll-scrubbed hero video
Build src/components/ScrollFilm.astro: a section about
[400vh] tall with a sticky full-screen stage. As the visitor scrolls through it, the video /public/
media/[file].mp4 plays forward frame by frame, and backwards when they scroll up, using GSAP
ScrollTrigger with scrub: true. First, re-encode the video for smooth seeking with ffmpeg: H.264,
keyframe every frame (-g 1), no audio (-an), 1920px wide, -movflags +faststart, and keep the original
in /_archive. If seeking still stutters, extract frames to WebP (about 120 to 180 frames) and draw them
to a canvas instead. Overlay three lines of copy that fade in at 20, 50 and 80 percent progress:
"[line 1]", "[line 2]", "[line 3]". Poster image first. Mobile and reduced motion get the poster and
the copy, no scrubbing.
```

MAKE IT SCRUB LIKE BUTTER

Normal web video is compressed so it only has a full picture every few seconds, which is why scrubbing it backwards stutters. The prompt fixes that by re-encoding with a keyframe on every frame, and falls back to a stack of still frames drawn on a canvas if it still isn't smooth. That's how the big launch sites do it.

RULE OF THUMB Use a clip with one slow camera move and roughly 400vh of scroll for 10 seconds of video. Shorter scroll feels rushed. Longer feels like homework.

PROMPT 16 · PAGE TRANSITIONS

```
[RULES]

TASK: Page transitions
Add Astro View Transitions (ClientRouter) with a custom transition: [a thin line in the accent color
sweeps across the screen, the old page fades and lifts 20px, the new page rises
in], about 700ms total. The logo and nav persist without flicker. Re-initialize GSAP, ScrollTrigger and
Lenis correctly after each navigation (kill old triggers, then refresh). Reduced motion: a plain quick
fade.
```

3D AND GLOW

PROMPT 17 · THREE.JS 3D SCENE

```
[RULES]

TASK: 3D scene in [section]
Install three. Build src/three/scene.ts and mount it in [section] on desktop only (1024px and up, fine pointer). Scene: [describe it, e.g. a slow camera drift over a meadow at golden hour with a glass cube catching the light]. Light it with a free HDRI from Poly Haven (polyhaven.com, CC0) for real reflections, ACES or AgX tone mapping, soft shadows. The camera moves with scroll progress through the section using GSAP ScrollTrigger. One renderer only, pixel ratio capped at 2, rendering paused when the section is offscreen or the tab is hidden. Mobile, low-power devices and reduced motion get a still image rendered from the same scene. Load models through one shared GLTFLoader with Draco and Meshopt support, and leave a drop-in folder /public/models/custom/ so I can replace the model later without code changes. Add every model, texture and HDRI to the credits data.
```

WHAT WE LEARNED ON AURA HOMES

The Aura site has hyper-real grass, pine trees, polycarbonate glass and a steaming cedar hot tub. The big lesson from that research: **what makes 3D look real is light, not more triangles.** A free outdoor HDRI from Poly Haven, good tone mapping, soft shadows and a bit of fog beat a million extra polygons. And one renderer per page, or your visitor's laptop takes off.

PROMPT 18 · HOVER GLOW TITLES

```
[RULES]

TASK: Title glow on hover
On desktop, headings (H1, H2 and card titles) get a soft glow that "heats up" behind them on hover: a blurred radial gradient in [accent color] at low opacity, easing in over about 1.2s and cooling out over about 2.4s. Build it in CSS first (a ::before pseudo-element, animating only opacity and transform). Optionally upgrade to one shared WebGL canvas with animated noise if it stays under 1ms per frame. Keyboard focus triggers it too. Touch devices and reduced motion get a static faint glow or nothing.
```

SPEED, CREDITS, QA

PROMPT 19 · MEDIA AND PERFORMANCE PASS

```
[RULES]

TASK: Media and performance pass
Find every image and video on the site. Images: export AVIF and WebP at 1280, 1920 and 2560 widths and serve them through Astro's Picture component with sizes. Videos: encode a WebM (AV1) and an MP4 (H.264, crf 23, -movflags +faststart, no audio), each loop under about 4 MB where possible, with a poster frame. Video tags: muted, playsinline, loop, preload="metadata". Mobile and save-data users get the poster only. Keep originals in /_archive/originals. Preload the two brand fonts. Write scripts/optimize-media.mjs so I can rerun this on new files. Report a before and after size table and a Lighthouse estimate (target: LCP under 2.5s, no layout shift).
```

PROMPT 20 · CREDITS PAGE

```
[RULES]

TASK: Credits page
Create src/data/credits.ts: a typed list of { name, author, license, link, usedFor, category }, with categories "Code and libraries", "3D models", "Textures and HDRIs", "Fonts", "Inspiration". Build /credits from it: a calm page with one intro line ("[Brand] stands on the generosity of open-source makers. Thank you."), then each category as a clean list with the name linked to the source and the license linked. Seed it with everything that ships to the browser (read each package's license in node_modules), plus Astro, GSAP (Standard no-charge license, https://gsap.com/standard-license), Lenis, three.js and the fonts. Add a small "Credits" link in the footer. Add a comment at the top of credits.ts: anything borrowed gets an entry in the same commit.
```

PROMPT 21 · QA WITH PLAYWRIGHT

```
[RULES]

TASK: QA pass
Install Playwright as a dev dependency. Write tests/qa.spec.ts that, for every page at 375px, 768px, 1440px and 1920px: loads the page, fails on any console error or 404, takes a full-page screenshot into /qa/screenshots, checks every internal link resolves, checks every image has alt text, and checks the menu opens and closes with the keyboard. Also run it once with reduced motion on. Run npm run build, then the tests. Fix anything you broke. Report what you fixed and anything you need me to decide. Confirm with git diff that the protected files are unchanged.
```

Playwright is a free tool that opens your site in a real browser by itself and checks it, at phone, tablet and desktop sizes. playwright.dev. The credits page is for every bit of open source you borrowed. Saying thank you is free. Not saying it is sometimes a license violation.

08

REVIEW AND FIX

Screenshot every page on desktop and on your phone. Hand them to Grok Bot with your brief and brand brain, and get a fix list where every fix is already a ready-to-paste prompt.

PROMPT 22 · THE FIX LIST

```
Here are screenshots of my site on desktop and mobile: [attach]. Here is my Site Brief and brand
brain: [attach]. Act as an Awwwards juror and my brand director. Give me a numbered fix list, most
important first. Each fix must be specific ("headline is 14 words, cut to 6", not "make it pop") and
written as a ready-to-paste Grok Build TASK with my RULES paragraph on top. Also tell me what to keep
so I don't break the good stuff.
```

BEFORE YOU CALL IT DONE

- [ ] **Hard refresh every page.** Then open it on your actual phone, in daylight.
- [ ] **Turn on reduced motion** in your accessibility settings and scroll the whole site. Still works, still reads.
- [ ] **Run the homepage through PageSpeed** pagespeed.web.dev once it's live. Aim for a fast first load.
- [ ] **Check /credits** lists everything you borrowed.
- [ ] **Check the protected parts** with git diff. Unchanged means the autopilot held.

PART THREE

MAKE IT STAND OUT.

A working website is the floor. Nobody remembers the floor. This part is how you get from nice site to wait, who made this.

09

THE NO SLOP RULES

Left alone, an AI builds the website it built for everyone else this morning: purple gradient, centered headline, three cards with emoji, a button that says Learn More. This rulebook bans the defaults and tells it what to do instead. Paste it into your RULES paragraph, right before "Commit to git".

PROMPT 23 · NO SLOP RULES

```
NO SLOP RULES. Never use: purple-to-blue or rainbow gradients; a centered hero with a floating stock
blob or abstract 3D shape; the generic row of 3 feature cards with icons; emoji as icons; the words
unlock, elevate, seamless, revolutionize, empower, game-changer, delve, leverage, cutting-edge,
journey, "in today's fast-paced world" or "it's not just X, it's Y"; lorem ipsum or placeholder copy;
stock photos of smiling people pointing at laptops; the default Tailwind look (gray-50 backgrounds,
rounded-xl cards, indigo buttons, everything centered); every section with the same rhythm (headline,
subline, grid, repeat); invented testimonials, fake logos or made-up numbers. Instead, always: one bold
idea per section, and say what it is in your report; real copy in the brand voice, specific and human;
asymmetric layouts with intentional empty space; a deliberate type scale with big contrast between
display and body; motion with a purpose (it guides the eye, reveals the story or gives feedback, never
decoration); specific details only this brand would have; brand colors and fonts only. If you're about
to do something you've seen on a thousand sites, stop and do the more interesting version. If something
isn't real yet, mark it TODO instead of faking it.
```

ELEVATED BY DEFAULT

Your RULES template and the write-all-the-prompts meta-prompt now carry one more line: **aim for an Awwwards Site of the Day result, not a regular website**. One bold idea per section, real copy, specific details. It sounds like a small thing. It changes what the AI reaches for on every single prompt.

UPDATED Copy the updated RULES template and meta-prompt from prompt-guide.md. They already include both lines.

THE VISUAL INTERVIEW

The site interview decides what the site says. This one decides how it feels. You come out with a Visual Direction brief, which you then attach to the meta-prompt so every build prompt knows the look.

PROMPT 24 · INTERVIEW ME ON LOOK AND FEEL

```
You're an award-winning art director. Read my brand brain and Site Brief: [paste or attach]. Interview
me about the look and feel of the site, one question at a time, and wait for each answer. Show me
examples or options when I'm stuck. Cover:
1. Five mood words, and three words it must never feel like.
2. Three to five Awwwards sites I love (awwwards.com, Sites of the Day), and exactly which part of
each: the type, the scroll, the layout, the color, the motion.
3. Type pairing: how loud the headlines should be, and how big the contrast between headline and body.
4. Color temperature: warm, cool or neutral, light or dark, and how often the accent color shows up.
5. Motion personality: calm and expensive, snappy and playful, heavy and cinematic, or something else.
Give me a real-world comparison for each.
6. Texture: clean and flat, film grain, paper, glass, noise, or something physical from my world.
7. Imagery style: photo, illustration, 3D or video, light and time of day, real people or no people,
and what never shows up.
8. The signature moment: the one thing people will screenshot and send to a friend.
Then write a one-page Visual Direction brief: mood, references and what to steal from each, type scale
with sizes, color usage with hex codes, motion rules (eases, durations, what moves and what never
moves), texture, imagery rules, the signature moment, and a "never do" list. Ask me what you got wrong.
```

THE SIGNATURE MOMENT

Question 8 is the one that matters. Every site people remember has one thing they screenshot and send to a friend: a menu that opens like a horizon, a video that plays as you scroll, steam rising off a hot tub. Decide yours on purpose, or the site won't have one.

STANDOUT FEATURES

Now the AI pitches you features like an agency creative technologist would, explains each one in English, and helps you pick the few that actually fit. The ones you don't pick are not lost. They're Version 2.

PROMPT 25 · STANDOUT FEATURES INTERVIEW

```
You're the creative technologist on an agency team that wins Awwwards. Read my Site Brief and Visual
Direction brief: [paste or attach]. Propose features that would make this site memorable, then
interview me about them one at a time. Consider at least: a signature hero interaction, scroll
storytelling, a cursor effect, a 3D moment, micro-interactions (buttons, links, forms), an optional
sound toggle (off by default), page transitions, and a playful easter egg. For each one, explain in
plain English what the visitor sees and feels, why it fits my brand (or why it doesn't), how heavy it
is for phones, and a version for people who turn motion off. Ask me which ones excite me. Then pick the
3 to 5 best for my brand, rank them, and for each write: the plain-English description, where on the
site it lives, and a ready-to-paste Grok Build TASK with my RULES paragraph on top. Cut anything that's
a trick without a reason.
```

FEATURE	WHAT THE VISITOR GETS
Signature hero interaction	The first thing they touch does something only your site does.
Scroll storytelling	The page tells a story as they scroll, like a short film they control.
Cursor effect	The pointer reacts to what it is over. Desktop only.
3D moment	One real 3D scene where it earns its place.
Micro-interactions	Buttons, links and forms that feel alive when touched.
Sound toggle	Optional ambient sound, off by default, always.
Page transitions	Moving between pages feels like one continuous place, not a reload.
Easter egg	A small reward for the curious. Keeps people poking around.

ELEVATION PASSES

Point each one at a single section or the whole site. Run them in this order: type and spacing, motion, imagery, copy.

PROMPT 26 · TYPOGRAPHY AND SPACING PASS

```
[RULES]

TASK: Typography and spacing pass on [section or whole site]
Audit and upgrade the type and spacing. Define one type scale (display, h1, h2, h3, body, small,
caption) with real contrast between display and body, using only the brand fonts, and use it
everywhere. Tighten letter spacing on big display type, loosen it on small caps. Set body text at 16 to
18px with a line length of 45 to 75 characters and line height around 1.5. Create one spacing scale and
use it for every gap. Break the identical section rhythm: vary alignment, widths and empty space so
each section has its own shape. Report before and after for each section in one line.
```

PROMPT 27 · MOTION PASS

```
[RULES]

TASK: Motion pass on [section or whole site]
Audit every animation. Remove anything that moves just because it can. For what's left, give each one a
job (guide the eye, reveal the story, or give feedback) and say which job in your report. Use one
shared set of eases and durations from src/scripts/motion.ts. Add the one motion moment from the Visual
Direction brief if it's missing. Stagger related elements, never animate everything at once, animate
only transform and opacity, and make sure reduced motion gets a calm, complete version. Report what you
removed, what you kept and what you added.
```

IMAGERY AND COPY

PROMPT 28 · IMAGERY PASS

```
[RULES]

TASK: Imagery pass on [section or whole site]
Audit every image and video against the Visual Direction brief (light, color grade, subject, what never shows up). List anything off-brand, generic or stock-looking. For each, write a Grok Imagine prompt for a replacement in the brand's world and leave a clearly named placeholder slot. Crop for intent: make sure every image leaves calm space where text sits, and that the hero image reads at phone size. Apply one consistent color treatment (grade, grain or duotone) so the whole site feels like one world. Report the list and the prompts.
```

PROMPT 29 · COPY PASS

```
[RULES]

TASK: Copy pass on [section or whole site]
Rewrite every headline, subline, button and caption in the brand voice from the brand brain. Kill every banned word and every generic line ("Welcome to our website", "We are passionate about", "Learn more"). Headlines: short, specific, a little surprising. Buttons: say exactly what happens ("Book a call", not "Submit"). Mark anything that needs a real fact (a number, a name, a quote) as TODO instead of inventing it. Report a before and after table.
```

The copy pass marks anything that needs a real fact as TODO instead of inventing it. An AI will happily write "Trusted by 10,000 customers" for a business that opened on Tuesday. Don't let it.

THE AWWWARDS JURY

Awwwards judges score Design, Usability, Creativity and Content. Your AI can do a decent impression, as long as you tell it not to be nice. Then a second prompt turns the fix list into build prompts, so the review becomes work instead of feelings.

PROMPT 30 · AWWWARDS JURY REVIEW

Act as a jury of three Awwwards judges: a designer, a developer and a brand strategist. Review my site: **[live URL, or attach screenshots of every page on desktop and mobile]**. Here is my Site Brief and Visual Direction brief: **[attach]**. Score it out of 10 on Design, Usability, Creativity and Content, the way Awwwards does, with two lines of honest reasoning for each score. Then tell me: the first impression in 3 seconds, the single thing holding it back the most, anything that looks like AI slop or a template, and what's already good enough to keep. Finish with a numbered fix list, most important first, each fix specific enough that a developer could do it without asking a question. No flattery. If it's a 6, say 6.

PROMPT 31 · TURN THE FIX LIST INTO BUILD PROMPTS

Turn this fix list into Grok Build prompts: **[paste the jury's fix list]**. Group related fixes so each prompt is one job and one commit, and order them by impact. Every prompt is a single copy-paste block that starts with my full RULES paragraph (including the NO SLOP RULES and the elevated-by-default line), then "TASK: **[name]**", then exact instructions, files to touch, what done looks like and what to report. Each prompt must work on its own. Finish with the order to run them in and what to check on localhost after each.

POST-LAUNCH UPGRADE

Run this when the site is live. A week later is better, when you look at it with fresh, slightly annoyed eyes. The AI reviews the site first, before you tell it anything, so you get an honest outside look. Then it interviews you and writes the upgrade prompts.

PROMPT 32 · QUALITY UPGRADE INTERVIEW

```
My site is finished and live at [URL]. Read my Site Brief, Visual Direction brief and brand brain:
[attach]. First, review the live site yourself (open it, or use these screenshots:
[attach]) on desktop and mobile, and write down what feels flat, generic, slow or confusing, before I
tell you anything. Then interview me one question at a time: which pages I avoid showing people, where
visitors drop off or get confused (if I have analytics, ask for them), what people have said about it,
what feels flat to me, what I'd be proudest of if it were better, and what I've been too scared to try.
Then write an upgrade plan with no more than 8 upgrades, ranked by impact versus effort, each explained
in one plain-English sentence. Then write every upgrade as a ready-to-paste Grok Build prompt with my
full RULES paragraph on top (including the NO SLOP RULES and elevated by default). Protect everything
that already works.
```

WHY IT REVIEWS FIRST

If you tell it what you think is wrong, it agrees with you and misses the thing you can't see anymore. Let it look cold, like a stranger would. Then compare notes.

RULE Limit it to 8 upgrades. Twenty upgrades is a rebuild wearing a disguise.

MOST SITES SHOULDN'T USE ALL OF THIS

10

PICK WHAT YOU NEED

YOUR SITE	USE	SKIP
Local business, 3 to 5 pages	Steps 02 to 04, hero, nav, sections, smooth scroll, reveals, media pass, QA	3D, scroll video, glow
Personal brand or creator (Antigirl)	All of the above, plus one scroll video, page transitions, hover glow	Heavy 3D
Product launch or wow landing page	Everything, including one 3D scene	More than one 3D scene per page
Guides library (the AntiHero site)	Hero, nav, a card grid of guides with filters, reveals, transitions, credits, QA	Scroll video, 3D

RULES OF THUMB

- **One wow per section.** Three effects fighting is not three times the wow.
- **Motion appetite 1 to 4:** smooth scroll and reveals. **5 to 7:** add a scroll video and transitions. **8 to 10:** add 3D. Respect the number you gave in the interview.
- **Mobile is half your visitors.** Every heavy effect needs a calm phone version.
- **Effects come last.** Content and structure first.
- **Ship version 1.** The Version 2 list will still be there next weekend. It's very patient.

THE PILOT AND THE AUTOPILOT

The AI can build anything you describe. It can't tell you what's worth building, who it's for, or when to stop. That's the job. That was always the job. The typing was never the hard part.

NOW GO BUILD IT.

Homework: run the interview this weekend and post your Site Brief in the group. One page. Brave beats polished. Bonus points for the one Awwwards site you'd steal from, and why. The AntiHero AI group is free, sells nothing, and will tell you honestly if your hero section looks like a dentist's.
